

SYNOPSIS

Blinkit Sales Performance Analysis Using Power BI

1. Introduction

Blinkit is a retail grocery delivery platform that provides quick access to essential products through multiple outlets located across different regions. With a large number of products, outlet types, and customer purchasing patterns, analyzing sales performance becomes essential for effective business decision-making.

This project focuses on analyzing Blinkit's sales data using Power BI to understand how various factors such as outlet location, outlet size, product category, and product attributes influence sales performance. The dashboard provides a visual representation of key metrics that help management monitor revenue trends and identify areas for improvement.

2. Business Problem

A retail grocery delivery company (Blinkit) wants to analyze its sales performance across different outlet types, locations, and product categories. Management requires insights to determine which product categories generate the highest revenue, how outlet characteristics affect sales, and how product attributes such as fat content influence consumer purchasing behavior.

The goal is to develop a sales performance dashboard that enables decision-makers to monitor total sales, evaluate outlet performance, analyze product demand, and identify the key factors that drive revenue. This analysis helps the company optimize product assortment, improve outlet performance, and support data-driven operational strategies.

3. Objectives of the Project

The main objectives of this project are:

- To analyze overall sales performance of Blinkit outlets.
- To identify the most profitable product categories.
- To evaluate sales performance across different outlet types and locations.
- To analyze the impact of product attributes such as fat content on customer purchasing patterns.
- To build an interactive Power BI dashboard that provides meaningful business insights.

4. Key Performance Indicators (KPIs)

The dashboard includes the following key metrics to evaluate sales performance:

Total Sales

Represents the total revenue generated from all products sold across outlets.

Average Sales

Shows the average revenue generated per transaction or item.

Number of Items

Indicates the total count of items sold.

Total MRP

Represents the total maximum retail price of all products sold.

5. Dashboard Visualizations

The dashboard includes several visualizations to analyze sales performance from different perspectives.

Outlet Establishment Trend (Line Chart)

This chart shows how total sales vary based on the year outlets were established. It helps identify sales trends over time.

Total Sales by Fat Content (Donut Chart)

This visualization shows how sales are distributed between low-fat and regular products, helping analyze customer preferences.

Total Sales by Item Type (Horizontal Bar Chart)

This chart identifies the product categories that generate the highest revenue.

Fat Content by Outlet (Stacked Bar Chart)

This visualization compares product fat content sales across different outlet locations.

Outlet Location Performance (Bar Chart)

This chart compares sales performance across Tier 1, Tier 2, and Tier 3 cities.

Outlet Size Distribution (Donut Chart)

This visualization shows how outlet size contributes to total sales.

Outlet Type Performance (Table/Matrix)

This table compares outlet types based on metrics such as average sales, item visibility, number of items, and total sales.

6. Expected Outcomes

The Power BI dashboard helps management gain valuable insights, including:

- Identification of the most profitable product categories.
- Understanding how outlet location and size affect sales performance.
- Analysis of consumer preferences based on product attributes.
- Evaluation of outlet performance across different regions.
- Monitoring long-term sales trends based on outlet establishment year.

These insights assist the company in improving operational efficiency and optimizing product offerings.

7. Tools and Technologies Used

- **Power BI Desktop** – Data visualization and dashboard development
- **Microsoft Excel** – Dataset storage and preprocessing
- **DAX (Data Analysis Expressions)** – Calculation of key performance indicators

8. Output:

9. Conclusion

This project demonstrates how data visualization can be used to analyze retail sales performance effectively. By using Power BI, the Blinkit sales data was transformed into an interactive dashboard that highlights key business insights. The dashboard enables management to make informed decisions related to product strategy, outlet performance, and overall business growth.
